

WEAK-1 ASSIGNMENT

What is Machine Learning?

- Machine learning is a branch of artificial intelligence that enables algorithms to uncover hidden patterns within datasets. It allows them to predict new, similar data without explicit programming for each task.
- Machine learning finds applications in diverse fields such as image and speech recognition, natural language processing, recommendation systems, fraud detection, portfolio optimization, and automating tasks.

What is Supervised Machine Learning?

- Supervised Learning algorithms are trained on the labeled data. They learn to map input features to targets based on labeled training data.
- There are two main types of supervised machine learning:
 1. Regression
 2. Classification

What is Regression and Classification?

- Regression : Regression algorithm learns to predict continuous values based on input features.
Example: Predicting house prices based on size and location, or forecasting sales based on historical data
- Classification : Classification algorithm learns to assign input data to a specific category or class based on input features. The output labels in classification are discrete values.
Example: Spam Filtering , Image Recognition.
